

# ABSTRACT OF THE DISCLOSURE

In a seal mechanism which constitutes a port switching portion in a pump mechanism of a paste ejection apparatus that ejects paste, and which prevents leakage of the paste from  
5 a seal portion between a plunger block rotating with a plunger and a fixed seal block(between a seal surface and a sliding surface), a housing portion is formed by opposing an outer surface provided for the seal block to an inner surface extending axially from the cylinder block, and a ring-shaped external  
10 seal member formed by combination of an O-ring and self-lubricant material such as PTFE is attached into the housing portion.

Hereby, it is possible to prevent the paste that has leaked from the seal portion from leaking to the outside of the housing portion by the external seal member.
